

This book explains what chemical reactions are, what elements, atoms and molecules are and what happens to them during chemical reactions. It explains what acids and alkalis are and how they neutralise each other, as well as their effect on substances such as metals. The book looks at how fossil fuels were formed, as well as describing the the chemical reactions that happen when we burn them. The book ends with a look at the new materials and fuels that chemists are developing.

A chemical reaction occurs when matter mixes with other matter and causes a change. During such a reaction, two or more elements or compounds form a new product. The elements or compounds that change in a chemical reaction are called reactants. The compounds that chemical reactions create are called products.

Chemical reactions differ from physical changes, which include changes of state, such as ice melting to water and water evaporating to vapor. If a physical change occurs, the physical properties of a substance will change, but its chemical identity will remain the same. 16 Jul - 18 min Physical Science Series: Chemical Reactions new substances in chemical reactions a.
