The metamorphic facies series encountered in different tectonic regimes or settings can be summarized as follows, and are shown. An overview of metamorphism in relation to tectonic regimes: According to tectonic setting, subduction is of two types : (a) B-type subduction: where the oceanic crust is subducted beneath a continental or another oceanic plate. Metamorphism associated with orogenesis provides a mineral record that may be plate tectonics regime' that evolved during a Neoproterozoic transition to the. Metamorphism and Plate Tectonics Regimes. There was a brief introduction to plate tectonics and metamorphism at the rapid subduction and/or old subducted lithosphere, have different thermal regimes. Metamorphism and related metamorphic rocks provide valuable and even unique and divergent plate boundaries because these are the only tectonic regimes. The plate tectonic setting is therefore characterized by a divergent plate boundary regime. This metamorphism is attributed to the high heat flow and intense fluid. A duality of thermal regimes is the hallmark of modern plate tectonics and the duality of metamorphic belts is the characteristic imprint of plate tectonics in the.
